

# SMT-based constraint solving in Lean 4

The [cvc.lean](#) library: safety and ergonomics

# cvc.lean: context

- collaboration the [University of Iowa](#) and the [cvc5 team](#)
- [Lean 4](#) library exposing the [cvc5](#) (C++) SMT solver's API --- using C-level FFI
- focus on [safety](#) and [ergonomics](#)
- public but [unstable](#), not officially released: everything can change (and will improve)
- offshoot of the [lean-smt](#) project

# cvc5 libraries: architecture

# Let me just show you

- access the (documented) demo file here:

[github.com/anzenlang/cvc.lean/blob/2025\\_02\\_demo/CvcTest/Demo/2025February.lean](https://github.com/anzenlang/cvc.lean/blob/2025_02_demo/CvcTest/Demo/2025February.lean)

- or retrieve this link (and the slides) at [anzenlang.io/blog](https://anzenlang.io/blog)

# Advanced features

- interpolation
- quantifier-elimination
- partial information retrieval in *unknown* mode
- proof / unsat-core retrieval in *unsat* mode
- sat-core in *unsat* mode

# Future work

- expose more of the underlying cvc5 C++ API: `String`, `Array`, `BitVector`...
- stronger constraints on overloaded functions such as `add/mul/etc`.
- push the `Safe.SmtM` environment further
  - `InitM`: pre-`SmtM`, only allows `setOption`-like commands and `setLogic` returning an `SmtM` (which would not allow these commands)
  - ask for a proof that `produceModels` is set when running `getValue/getModel`?
- `more flexible` unsafe/safe(r) API-s
  - ergonomic, safe bridges between the two API-s would let users benefit from safety where appropriate for their use-case

# Thank you!
